EXPLORE THE VAST SEAS

Fishing is an essential skill for any survivalist. There are few places without natural bodies of water, and many experts go so far as to say that mastering fishing methods and techniques may be the most important food sourcing skill that will help in a survival situation.

If you're going to be stranded somewhere, it pays off in more ways than one when your fishing skills are put into use.

If there is no water visible in your surrounding area then there is still a good chance that water is somewhere nearby.

Follow animals to water. Wild animals need water like you, so keep your eyes peeled for wildlife that may lead you to lakes, streams and ponds. Flies and Bees like to stay within a couple of miles from their nests and need access to water.

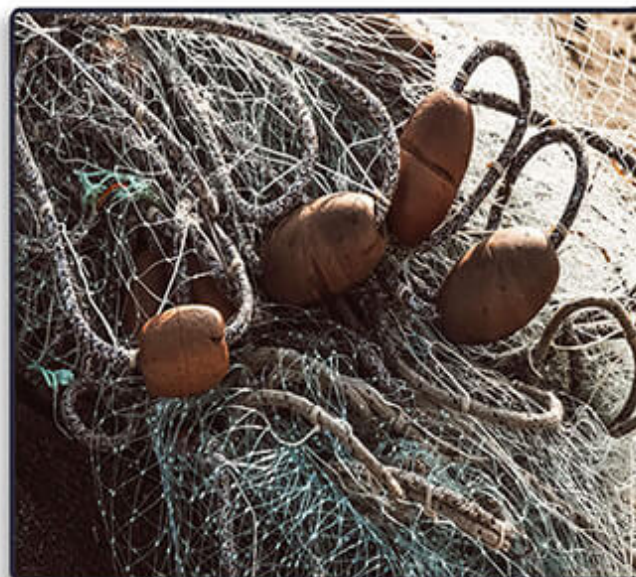

Listen for frogs when darkness falls; they, too like to stick close to water.

FISHING ADVANTAGES

A big advantage of fishing is that most methods do not require you to use up a lot of your energy. Even if your attempts are unsuccessful - which happens often times. A positive key lesson is that you have not depleted many important needed calories during the failed attempts.

The methods that involve nets, traps and trot lines are essential to learn because they make the actual catch more automated for you. This is ideal in a survival scenario because most of the time they will be numerous things requiring your attention.

Here in this ebook you are going to learn many of these methods.

Survival Fishing

Fishing is one of the oldest survival skills in existence. These methods for catching fish or other edible seafood can be used as an important food source to keep your family alive when times get tough. Just make sure you spend some time practicing these methods before relying on them! Lets dive right into all the pretty cool ways and methods of catching fish in a survival situation.

FISHING WEIR TRAPS

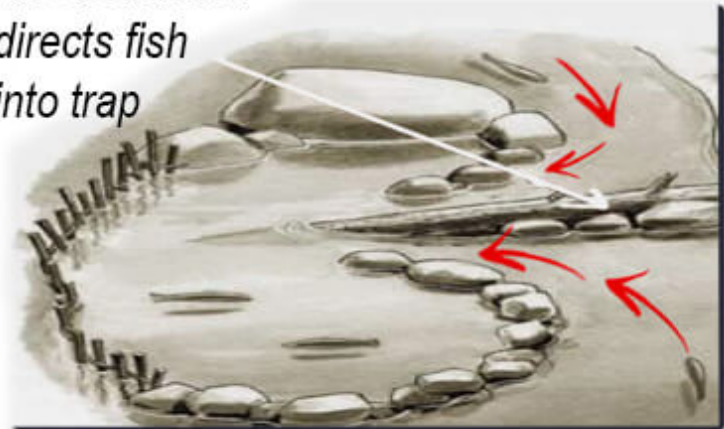

Fish weirs are human-made fish traps that have been used for centuries to catch fish.

They can be made out of anything from stone, reeds or wooden posts and they're placed strategically in river channels or tidal lagoons.

These fish traps are typically on rivers or streams and are shaped either circular or wedge-shaped and need an upstream opening. The basics of how they work is the fish swim in and are trapped within the upstream of the current.

Tidal fish traps are usually built with blocks or boulders and have solid low walls. At high tides fish swim alongside the tops of the walls and as the water recedes with the tide, they are trapped behind it.

An obstruction directs fish into trap

GILL NETS

Gill nets can be a fisherman's best friend. They allow you to set and forget it. Leaving you free to do other jobs while your gill net does the work.

As easy and simple as this may sound there are a few considerations to remember. The most important thing to remember is to tie the right mesh size for the fish you're targeting.
