Home Made Beer Is Not As Hard To Make As You May Think

It seems like it would be very difficult to make your own beer, with all the ingredients and time it involves. While it is a time consuming process, involve correct measurements and such, it really isn't as difficult as it seems.

There are four main ingredients needed to make beer, and many different tools used to cook these ingredients.

The first ingredient is water. It has to be completely filtered and cleaned, so that the other ingredient's flavors can be released.

The second ingredient is barley. It is important because it can be preserved a long time after it is gathered. The barley is what gives the beer its color and taste.

Hops is the third ingredient used in making beer. This is a male or female flower that comes from a climbing plant. Only the male hops are used for making beer, and this is the ingredient that gives beer its signature bitterness.

The fourth and final ingredient is yeast, which changes the sugars in the mix into alcohol and carbon dioxide. There are a few different types of yeast used, depending on the beer.
